

Building a warehouse management website for Mobilefone Thai Nguyen

Nguyen Thi Thu Thao

Abstract: This topic focuses on designing and implementing an intelligent warehouse management system for Thai Nguyen Telephone Joint Stock Company (Mobilefone Thai Nguyen). The research context is based on the actual situation, where the current warehouse management operational processes face many limitations. The objective of the topic is to build an automated warehouse management website to enhance operational efficiency and optimize the inbound and outbound processes. The research method combines both theory and experimentation to ensure the system meets the specific requirements of the enterprise. The expected results will bring significant practical significance, contributing to the improvement of warehouse management in the information technology industry.
