

Use JSP to build an employee attendance management module for 2NF-Software Hanoi company.

Doan Van Hien

Abstract: In the current context, effective timekeeping management is a key factor for the sustainable development of organizations. This project aims to design and implement an employee timekeeping management system using JSP (Java Server Pages) for 2NF-Software Hanoi Company. Through the research process, the project combines both theoretical and experimental methods to build an easy-to-use interface while optimizing the timekeeping process. The expected outcome of this project is to provide a flexible and efficient solution for the company's human resource management, contributing to increased productivity and reduced labor costs.
