

Building an English learning support program on Android

Thân Văn Nam

Abstract: This topic aims to research and design a mobile application on the Android platform to support English learning. In the context of increasing demand for cross-border communication, mastering language skills has become more important than ever. The objective of the topic is to build an automated learning system to improve the effectiveness of the English learning process for users. The applied method combines theoretical research on linguistics and experimental development of mobile applications. The expected outcome of the topic will provide a useful tool to enhance the quality of education and communication within the community.
