

Building a guest management program for Thai Binh city camp based on WebGIS technology.

Nguyen Thi Thu Thao

Abstract: This topic focuses on building a guest management system for camps in Thai Binh City, aiming to meet the need for optimizing the process of managing customer information and accommodation locations. Through theoretical research combined with experimentation on WebGIS technology, the system is designed to provide efficient data retrieval, administration, and analysis capabilities. It is expected that this system will create significant value in enhancing service quality and improving camp management performance in Thai Binh City.
