

Building an integrated English learning software on the Android operating system

Nguyen Van Phu

Abstract: This project aims to focus on building a mobile application to support comprehensive English learning for users. Based on the increasing demand of learners seeking effective and flexible approaches, the project sets the goal of creating a digital platform that integrates diverse exercises for listening, speaking, reading, and writing. The research method applies a combination of modern linguistic theory and experimental development of a mobile application on the Android operating system. The expected results will contribute to improving the quality of foreign language education through technology.
