

Build a file management application for devices using the Android operating system.

Le Van Toi

Abstract: In the context of the strong development of mobile technology, the demand for file management and access on Android devices is increasingly high. This topic focuses on building a file manager application for the Android operating system with the goal of optimizing user experience and improving storage space efficiency. Through theoretical research and experimental implementation, the topic will analyze specific user requirements, design an easy-to-use interface, and optimize file management functions. The expected result is an application that effectively meets file management needs, contributing to the development of the Android ecosystem.

Keywords: Android application, File management, Operating system, Experimental deployment, User interface
