

Design of system software on the Android platform to support patient care and service in hospitals.

Pham Van Phuong

Abstract: In the current healthcare context, the necessity of optimizing patient care and service processes in hospitals is undeniable. This topic focuses on designing and implementing a software system based on the Android platform aimed at effectively supporting patient management and services. Through theoretical research combined with experimentation, this topic hopes to contribute an advanced technical solution that meets the hospital's requirements for improving the quality of medical care services. The expected results will bring optimal work performance and high patient satisfaction.

Keywords: Android software, hospital management, patient service, information technology, process improvement
