

Research on security issues for broadband mobile wireless networks.

Nguyen Van Hien

Abstract: In the context of the increasing number of cyber attacks on mobile wireless systems, this research focuses on addressing security issues in broadband mobile wireless networks. The main objective is to build an effective security system to prevent and detect attacks. Using a combined theoretical and experimental approach, this research not only analyzes potential risks but also proposes advanced technical solutions. The expected results will significantly contribute to enhancing network security in modern mobile environments.
