

Building a telecommunications equipment management system for the Yen Binh District Telecommunications Center.

Vu Minh The

Abstract: In the current context, effective management of telecommunications equipment is an urgent requirement for the Yen Binh District Telecommunications Center. This project aims to address this issue by building an automated management system for the equipment within the center. Through the process of research and application deployment, the project's goal is to create an optimal solution to improve work performance as well as enhance monitoring and control capabilities. The expected result is to provide a modern management platform, contributing to the sustainable development of the telecommunications industry.
