

Building an automatic attendance system using RFID technology and web-based management.

Le Hoang Giang

Abstract: This topic aims to address the issue of personnel management and access control in enterprises through an automatic attendance system. The objective is to build a system using RFID technology combined with web-based management, with the goal of improving work efficiency and the accuracy of the attendance process. Through the coordination of theoretical research and practical application deployment, this topic expects to contribute to the field of personnel management while affirming its high applicability in business practice.
