

Building a mobile Android application for tracking children's health at GHD Investment and Technology Joint Stock Company - Hanoi

Nguyen Thi Huyen

Abstract: In the context of an increasing number of children facing health issues, this topic focuses on developing an Android mobile application system for monitoring children's health. The objective of the research is to create an effective technological solution that helps parents and healthcare professionals monitor children's health remotely. The method used combines theoretical research on application system design with experimental implementation on the Android platform. The expected outcomes of the project not only improve the quality of healthcare for children but also contribute to the development of technology in the field of preventive medicine.
