

Research and development of software for managing civil servants at the Informatics Center - Ministry of Science and Technology

Hoang Thi Kim Xuyen

Abstract: In the modern context requiring improved efficiency of state administrative management, this topic focuses on researching and developing a software system for managing civil servants to meet the needs of administrative organization. The objective of the work is to build and deploy a digital platform to support the monitoring, evaluation, and management of the civil servant workforce. The research method is based on a combination of civil servant management theory and practical experience from existing systems. Through the development process, the topic aims to provide a practical application solution for the Informatics Center - Ministry of Science and Technology while contributing to the field of civil servant management.
