

Building an online music search and download application on the Windows Phone operating system.

Dao Dinh Thien

Abstract: In the context of the rapid development of information technology, the issue of managing and accessing online audio content has become urgent. This topic focuses on building a music search and download application on the Windows Phone operating system to meet the convenient usage needs of mobile users. Through the research process, the application is expected to apply advanced algorithms to optimize search performance and fast download capabilities, while ensuring the safety and security of personal information. The results of the topic not only enhance the user experience but also contribute to the development of mobile technology.
