

Building a family financial management website

Ngo Tuan Thinh

Abstract: This topic focuses on building a website to support effective personal financial management. In the context of the increasing complexity of financial products and services, there is a need for an intuitive solution that helps users easily track and analyze their household financial situation. The goal is to develop a web system based on a combination of theoretical research and experimentation to build a user-friendly interface, while integrating features such as expense planning, financial reporting, and early warnings about financial risks. The implementation of this application is expected to contribute to improving the financial management efficiency of individuals and families.

Keywords: Financial management website, user interface, financial analysis
