

Building an English learning application on the Android mobile platform.

Nguyen Thi Thu

Abstract: In the context of the increasing demand for learning foreign languages via mobile devices, this topic focuses on building an application system to help users improve their English skills. The goal is to create a solution that diversifies the methods of learning vocabulary and pronunciation on the Android platform. By integrating modern technologies such as AI and machine learning, the topic will experiment and deploy this application to enhance users' learning effectiveness. The topic hopes to provide a new method for the process of learning vocabulary and pronunciation, while contributing to the field of mobile educational application development.

Keywords: Android app, learn English, AI, machine learning, educational development
