

Building an IT project management support tool with the goal of optimizing time, cost, and human resources.

Nguyen Thi Thu

Abstract: In the current context, effective management of Information Technology projects has become an important requirement. This topic aims to address the issue of optimizing time and labor costs in project management by building a supporting tool. Through research, the topic applies a method combining theory with experimentation to develop the system. The expected result is to create a practical application solution that can help businesses improve performance and reduce costs in information technology project management.

Keywords: Support tools, Project management, Information technology, Time optimization, Human resource costs
