

Building a geographic information system to support the management of high school information in the northern mountainous provinces

Do Thi Hue

Abstract: In the context of school information management requiring modern solutions, this topic focuses on building a geographic information system (GIS) to effectively support the information management of high schools in the Northern mountainous region. The project aims to improve the ability to collect, store, and analyze geographic data related to schools. Through a combination of theoretical research and experimentation, the topic aims to contribute a specialized GIS system to optimize educational information management in mountainous areas, enhancing the quality of teaching and learning.

Keywords: Geographic Information System (GIS), School Information Management, Northern Mountainous Region, Local Education
