

Building a mobile trading information application using HTML5

Nguyen Thi Le

Abstract: In the context of a rapidly developing mobile market, this topic focuses on building a mobile-based buy-and-sell information application using HTML5 technology. The main objective of the research is to create a utility platform that helps users easily search for and conduct buy-and-sell transactions via mobile devices. Through the research process, the topic applies a combination of theoretical and experimental methods to design and deploy this application. The expected result is a technological solution aligned with market development trends, contributing to the expansion of e-commerce interfaces on mobile platforms.
