

Building software to manage university campuses in Thai Nguyen Province based on GIS technology and Google Map API.

Vu Thi Thao

Abstract: In the modern context, effectively managing university campuses is an urgent issue to improve educational quality. This topic focuses on developing an intelligent management software for university campuses in Thai Nguyen province, based on GIS technology and Google Map API. Through theoretical research combined with practical application deployment, the topic aims to provide an effective technical solution to optimize the management and use of information about university campuses. The expected results offer high applicability in improving the quality of educational services and facilitating management tasks.

Keywords: GIS, Google Map API, School location management, GIS technology, Thai Nguyen province
