

Research ASP.net and apply it to build a Website for Thai Nguyen Telecommunications.

Tran Xuan An

Abstract: This topic aims to research and apply ASP.NET to the development of a specialized website for the telecommunications industry in Thai Nguyen province. In the current context, the demand for information and online transactions of telecommunications enterprises is increasing. The topic identifies the goal of building an intelligent web management system, meeting the requirements for collecting, processing, and analyzing data related to business operations and customers. The research method combines theory and experimentation to ensure the effectiveness of the solution. It is expected that the deployment of the system will bring significant efficiency in the management and customer service of telecommunications enterprises.
