

Building a traffic law multiple-choice test application on the Android operating system

Pham Hong Quan

Abstract: In practice, testing knowledge of traffic laws often faces many difficulties and limitations. This topic aims to address this issue by building an electronic multiple-choice test application on the Android platform to automate the testing process, thereby improving the effectiveness of education and management in the field of traffic safety. Through theoretical research combined with experimentation, the project aims to provide a versatile and flexible solution for authorities and individuals who need to update their knowledge of traffic regulations. The application is expected to contribute to improving public awareness of traffic laws and promoting a culture of safety on the road.
