

Research the Laravel framework and build a demo website to support employment statistics for students after graduation.

Nguyen Tien Dat

Abstract: This topic aims to research and implement the Laravel framework to develop a demo website system that supports statistics on job search activities of students after graduation. The context of the topic is set in the current situation, where information about career opportunities for graduates is often limited and not updated. The goal is to build a web platform to provide detailed statistical data and analysis on the labor market for students, while also helping schools and businesses better understand students' career trends. The research method includes studying Laravel theory, developing code, and testing the application in practice. The expected result is a robust and flexible web system that can provide valuable information for all stakeholders in human resource management and career strategy planning.

Keywords: Laravel framework, job statistics, graduating students
