

Building a mobile application to provide training information for students of the University of Information and Communication Technology - Thai Nguyen University.

Nguyen Van Thanh

Abstract: In the context of digital transformation in education, building an application that provides training information for students is a practical need. This project aims to develop a mobile system that supports students in managing their class schedules, searching for teaching content, and connecting with online learning resources. The research method applies a combination of digital education theory and experimental mobile application development. The expected results contribute an effective solution for students' autonomy in the learning process, while improving the quality of training at the University of Information and Communication Technology - Thai Nguyen University.
