

Building a material and equipment management program for the Phu Luong Telecommunications Center - Thai Nguyen Province

Huy Thi Tuyen

Abstract: In the context of increasingly complex telecommunications equipment management, this project aims to build an effective management system to optimize operational processes at the Phu Luong Telecommunications Center. Through theoretical research and experimental implementation, the project has applied modern information management technologies to solve the problem of equipment management. The expected outcome of this study is to improve work productivity while contributing to enhancing service quality at the center.
