

Developing a website to support the virtual stock trading system of MB Securities Joint Stock Company – Hanoi.

Khuất Thị Nhung

Abstract: In the context of the increasingly strong development of information technology, creating an online platform that allows customers to practice virtual stock trading has become an inevitable trend. This project aims to build a virtual stock trading system to support students and investors in experiencing a real trading environment without facing financial risks. Through the process of researching, designing, and deploying this application, the project combines theoretical methods of financial information management with experimentation to ensure the practicality and effectiveness of the system. The expected results of this project will significantly contribute to enhancing students' stock market analysis skills, while also providing a useful tool for new investors exploring this field.
