

Research and development of an accounting program for raw materials for the private enterprise Ban Thao - Thai Nguyen

Pham Kim Que

Abstract: This topic aims to research and develop a material accounting management system suitable for the reality of private enterprises. Through contextual analysis, the use of information technology in material accounting management has become increasingly important to enhance business operational efficiency. The main objective is to build and implement a specialized material accounting program that meets the detailed management requirements of enterprise materials. The research methodology includes reviewing relevant documents, analyzing the actual situation at Ban Thao enterprise, and designing the system based on an effective management model. The expected research results will contribute to improving control capabilities and enhancing the accuracy of material accounting reports, thereby supporting the business decision-making process of private enterprises.
