

Building an automatic car wash system

Nguyen Quang Trung

Abstract: In the context of the increasingly developing car wash service industry, building an automatic car wash system aims to optimize the vehicle cleaning process while reducing the burden on human labor. This topic focuses on researching and designing a system to automate the car wash process. Using a combination of theoretical and experimental methods, we aim to develop an efficient and cost-effective solution. The expected results of this topic not only contribute to technological innovation in the car wash service sector but also open up potential for widespread application in the future.

Keywords: automatic car wash system, automation, car wash technology
