

Design of cable television network for urban area

Pham Duc Canh

Abstract: This topic focuses on researching and designing a cable television network system suitable for urban areas, aiming to address issues related to television service quality and scalability. By applying a combination of theoretical research and experimental methods, the project's goal is to develop an effective solution to optimize the cable television network. The expected outcomes of this topic will contribute to enhancing user experience and improving the ability to meet the diverse demands of the urban television market.

Keywords: Cable television network, City, System design, Network upgrade, Quality of service
