

Research and deploy a user authentication system via Radius Server and AD on Windows Server 2008.

Pham Tung Lam

Abstract: In the current context of high cybersecurity demands, ensuring the confidentiality of information systems is a top priority. This project aims to research and deploy an effective user authentication solution based on a Radius Server and Active Directory (AD) on Windows Server 2008. Through theoretical analysis and experimentation, the project will provide readers with an overview of how to build and implement this authentication system. The expected results of the study not only help enhance security levels but also contribute to developing users' network administration skills.

Keywords: User authentication, Radius Server, Active Directory (AD), Windows Server 2008, Network security
