

Open source software application, building an internship registration management system for students of the Faculty of Information Technology - Thai Nguyen University of Information and Communication Technology.

Dinh Thi Nhu

Abstract: In the modern context, managing internship registrations for Information Technology (IT) students requires a specialized system to optimize the process. This topic proposes building an internship registration management system using open-source software to address the organization and tracking of internship sessions for students. The research method combines theory on information system management with practical application deployment. The system is expected to bring high efficiency in improving training quality, while contributing to the development of open-source software technology in Vietnam.

Keywords: Internship registration management system, open-source software, IT students, internship process, technology application
