

Building a support application for university entrance exam candidates on the Android operating system

Nguyen Van Manh

Abstract: In the context of increasingly emphasized education, this topic focuses on building an application to support candidates preparing for the university entrance exam on the Android platform. The objective of the research is to develop a digital tool aimed at providing necessary information and effective guidance for students. The approach includes theoretical research on educational applications, followed by implementation and practical testing with the participation of a pilot group. The expected results will confirm the high applicability of this application in improving the quality of university exam preparation.

Keywords: Android application, Higher education, University entrance exam candidates
