

# **Building a TOEIC practice application on the Android operating system**

**Dang Van Duong**

**Abstract:** In the context of high demand for English skills among workers and students, this topic focuses on developing a TOEIC practice application for the Android operating system. The goal is to create an effective support tool to enhance users' listening, speaking, reading, and writing abilities. Through theoretical research and experimental implementation, this application not only meets the requirements of the TOEIC exam but also guides users through diverse practice exercises. The expected outcome is that the application will provide a comprehensive solution to help improve learners' performance during their review process.

**Keywords:** Android application, TOEIC practice, mobile operating system, learning support tool
