

Building a student rental search website

Le Quang Vinh

Abstract: This topic aims to analyze and build a web system to support students in finding rental rooms. In the context of the increasing demand for student housing, the topic sets the goal of creating a technical solution that helps students easily access information about suitable rental rooms. Through theoretical research and practical application deployment, the topic will propose and analyze the main functions of the web system, while evaluating the effectiveness of the proposed solution based on user feedback. The expected result is to provide a practical technical platform, contributing to improving the quality of student life.
