

Building an online multiple-choice exam system for students.

Pham Thi Lan

Abstract: In the context of online education becoming increasingly popular, building a multiple-choice exam system specifically for students over the internet has become an urgent requirement. This project aims to develop a solution that diversifies learning assessment methods and enhances the effectiveness of online testing. Through a combination of theoretical research and experimentation, this project will apply new technologies to create an automated, secure, and flexible multiple-choice exam system. The expected outcome is a system that can be integrated into the current learning process, providing benefits such as enhancing objective assessment capabilities and reducing the workload for teachers.
