

Building an application to manage service locations for students on the Android operating system.

Tran Ba Thinh

Abstract: In the context of the increasing demand for services among students, this topic aims to address the issue of effectively searching for and organizing information about service locations. The project's objective is to build a mobile application on the Android operating system to manage service locations for students. The research method applies a combination of service management theory with application deployment experimentation. Through the use of mobile application development technology, the project expects to provide a useful solution that helps students easily access information about necessary services on campus and in the surrounding living environment.
