

Building a File Manager application on the Android operating system

Hoang Ngoc Ha

Abstract: In the context of the increasing demand for managing and accessing personal documents on mobile devices, this topic focuses on building a robust and efficient File Manager application for the Android operating system. The main objective is to create a solution that helps users easily organize, copy, move, and delete files on their smartphones or tablets. Through theoretical research on document management and practical application deployment, this topic aims to contribute to the field of mobile software and improve user experience when working with various types of files.

Keywords: File Manager, Android, Document Management, Mobile Application, Practical Implementation
