

Building classified ad posting software

Dang Quyet Tien

Abstract: In the current context of digitalization, building a classified ads posting software system has become important to meet the diverse information needs of users. This project aims to develop and deploy a web application that allows individuals and businesses to easily post and manage classified ads online. Through a combination of theoretical research and experimentation, the project focuses on designing a user-friendly interface, optimizing data processing performance, and ensuring information security. The expected outcome of the project is to provide a useful technological solution, contributing to the development of e-commerce in the local region.
