

Building a web system management software on Windows Phone

Nguyen Trung Kien

Abstract: In the context of the rapid development of information technology, building a web system management software on Windows Phone aims to meet the demand for convenient web access and usage on mobile devices. The objective of the project is to design and deploy a specialized application that allows users to interact with web services through the Windows Phone platform. The research method is based on a combination of mobile software development theory and experimentation to evaluate the system's usability. The project is expected to make an important contribution to promoting the trend of modernizing web interfaces on mobile devices.

Keywords: software development, Windows Phone, web system management
