

Learn about web programming and apply it to build a business locator system using Google Map API.

Nguyen Van Truong

Abstract: In the context of increasingly powerful information technology development, building a business location system based on the Google Map API platform has become extremely important. This topic aims to research and apply web programming to create a solution that allows users to easily view and manage the locations of sales points, offices, and business hotels through an online map. The methods used include both theoretical research on web programming techniques and experimental deployment of applications on the Google Map API platform. The expected result is to provide an effective location system, contributing to optimizing business management through technology.
