

Building an internship management website for the Software Engineering department using PHP language.

Bui Duc Hanh

Abstract: In the context of the increasing demand for effective management and monitoring of student internship processes, this project aims to build a dedicated website system for the Software Engineering (SE) department to assist lecturers and students in tracking and coordinating internship activities. Through theoretical research on internship management combined with application deployment on the PHP platform, the project's goal is to create an effective support solution for the internship process. The approach is based on requirement analysis and system design from concept to specific implementation. The project is expected to provide a modern management tool, helping to improve the quality of the internship program and contributing to the development of practical skills for students.
