

Building a news reading application on Android mobile devices

Nguyen Dinh Hung

Abstract: In the context of information digitization and the strong development of mobile technology, building a news reading application on the Android platform has become necessary. The objective of this project is to create an efficient news content management system, meeting the need for quick and convenient news updates for users. The project uses a combination of theoretical research and experimentation to develop the application, ensuring compatibility with various mobile devices. The expected result of the project is a high-quality news reading application product, providing a unique solution for users and making a significant contribution to the field of digital media.
