

Building a messaging application in Teen language

Nguyen Thi Ut

Abstract: In the context of modern society, the use of teen language and communication styles has become popular through social media platforms. This topic focuses on building a messaging application using teen language with the goal of meeting the fast and effective communication needs of teenagers. Through a combination of theoretical research and experimentation, the topic proposes technical solutions to preserve and honor teen language culture. The expected result is a useful application system that contributes to enhancing communication and understanding among the younger generation.

Keywords: Messaging applications, Teen language, Natural Language Processing (NLP), Social communication, Information technology
