

Building an online digital library system.

Vu Quang Trung

Abstract: This topic aims to research and develop an online digital library system, meeting the requirements for more effective management and use of e-books in practice. By integrating modern technologies such as artificial intelligence and databases, the system is designed to automate information management processes, recommend suitable materials, and provide a user-friendly interface. The objective of the research is to build a comprehensive solution that can be widely applied in educational and learning libraries. The expected results will significantly contribute to improving the management process of e-book information, effectively supporting the search and access to materials.
