

Building a multi-compatible Web interface using the Helix Framework platform

Dang Quang Hung

Abstract: In the context of the rapid development of the Internet and the need for web access from various devices, building a multi-compatible web interface has become important. This topic focuses on researching and implementing a web interface system using the Helix Framework platform. The objective of the topic is to develop an experimental solution aimed at optimizing user experience on mobile devices and desktop computers. The research methods applied include both theoretical research on Web Development and practical application implementation. The expected results of the topic not only provide the community with an effective multi-compatible solution but also contribute to the development of Helix Framework technology.

Keywords: web interface, Helix Framework, multifunctional web interface
