

Building a travel destination and weather lookup application for some Northern provinces.

Quach Van Man

Abstract: In the context of increasing demand for travel exploration among people, this topic focuses on building an application system for searching tourist destinations and weather information in the northern provinces of Vietnam. The objective of the research is to develop a utility tool that helps users easily find information about attractive tourist spots along with weather condition reports, thereby supporting effective travel itinerary planning. The research method combines theory and experimentation to ensure the applicability of the product. Through this topic, the desired notable outcome is to provide a useful solution contributing to the development of the local tourism industry.
