

GIS application for building a management program for industrial parks in Bac Ninh province

Phạm Đức Minh

Abstract: This topic aims to meet the need for effective management of industrial parks (IPs) in Bac Ninh province through the application of GIS. The practical context shows that organizing and monitoring IP activities requires a comprehensive solution to enhance productivity and connectivity within the supply chain. The research method is based on a combination of GIS theory and the experimental deployment of a management system. The expected results will significantly contribute to the modernization of IP governance, while creating a management model that can be widely applied in other IPs.
