

Building a store directory system for Thai Nguyen city.

Nguyen T Huong Quynh

Abstract: In practice, managing information about stores in Thai Nguyen city faces many difficulties due to the lack of an effective system for organizing and classifying information. This project aims to solve the problem of managing store information by building a store directory system. The research method combines theory with experimentation, focusing on designing a user interface and developing a database to store information about stores. The expected results will significantly contribute to improving business management performance and enhancing customer experience when searching for store information.
