

Some advanced configuration techniques and complex troubleshooting in Frame Relay

Nguyen Hong Quang

Abstract: This topic focuses on analyzing and applying advanced configuration techniques and troubleshooting solutions in Frame Relay networks. The research context arises from the practical need to improve the performance and reliability of data transmission systems over Frame Relay. The objective is to build an intelligent management system that allows optimizing Frame Relay configuration and minimizing recovery time after failures by combining theoretical research methods with experimentation. This implementation is expected to significantly contribute to enhancing service quality in Frame Relay networks, effectively supporting businesses that require high reliability in data transmission.
