

Building an Internet search application using search engine technology

Tran Thien Hue

Abstract: In the context of increasing internet traffic, building an efficient and accurate search system has become an urgent requirement. This project aims to develop a search application based on search engine technology to meet this need. The research process includes analyzing existing algorithms, selecting appropriate methods, and implementing an experimental system. The results of the project not only provide an effective technical solution but also contribute to improving the user experience on the internet.

Keywords: Internet search, search engine technology, search applications, system development, improving user experience
