

Build an application to update gold and foreign exchange rate information for devices using the Android operating system.

Phạm Văn Trọng

Abstract: This topic aims to meet the need for quickly updating information on gold prices and foreign exchange rates on mobile devices running the Android operating system. Through theoretical and experimental research, the project proposes a suitable technical solution to build an effective application, meeting users' requirements for tracking financial fluctuations. The expected results will contribute significantly to the field of mobile information technology and enhance the user experience.
